

# Identity Management

Identity Management implementation milestones provide measurable benefits and value as you move from standardized administration and monitoring to policy-based automation and password self-service and on to measuring access against policies for regulatory compliance. BMC Software is the right choice for helping you to achieve best-practice identity management because we:

- > Offer a decade of experience in successful deployments for our identity management customer base
- > Enable business-aware identity provisioning that can establish access rights based on a department's needs or an individual's job responsibilities
- > Implement an automated approval workflow process that streamlines requests, assignments and tracking
- > Deliver policy-based administration solutions that enforce password policies and change requirements
- > Integrate identity management and enterprise change management to accommodate both technology and organizational change

**Centrally manage identities and access privileges to assure that access to all distributed systems is coordinated with business policies and regulations.**

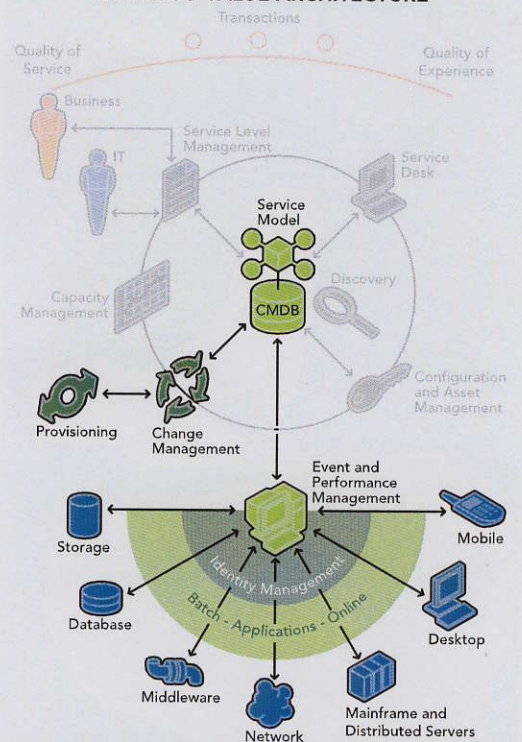

Protecting mission-critical data and assets is a business imperative. But making certain that the right people have access to the right information at the right time, without impeding productivity, poses a consistent challenge for most organizations.

Identity Management enables you to protect your business from destructive intrusion by:

- > Determining who has access and which systems warrant access and governance monitoring
- > Defining access procedures in accordance with relevant policy and governance requirements, such as Basel II and Sarbanes-Oxley
- > Quickly and accurately provisioning access to resources and applications, automating where appropriate with measures such as approval workflow and self-help password resets
- > Automatically notifying IT staff of security access incidents and taking policy-based remediation steps
- > Providing flexible reporting capabilities to demonstrate compliance with policy or governance requirements

Identity Management provides a direct path to Business Service Management by enabling centralized management of identities and access privileges, reducing operational costs and assuring that access is coordinated with business policies and regulations.
